

**AI moves knowledge.
Context doesn't follow.**

KNOBE — A trust layer for knowledge in motion.

The Infrastructure Gap

Software has Git

Software history is preserved through version control, commits, diffs, and inspectable change records.

Knowledge has nothing

Knowledge work has no equally ordinary habit for carrying the history of an idea as it moves through systems.
through systems.

The AI Boundary

When knowledge crosses an AI boundary, it is stripped of its origin, fidelity limits, and context.
You get the content, but lose the object.

The KNOBE Protocol

A single file that carries its own proof.

Plain-Text Format

Built entirely on Markdown with embedded cryptographic provenance (SHA-256).

Open Standard

CC BY 4.0. No platform dependency. No vendor lock-in.
No DRM.

Preserved Context

Carries its own origin, transformation history, attribution, and fidelity limits.

Zero Dependencies

Fully verifiable locally with a simple 495-line Python Python script.

Enterprise-Grade Compliance

Tech partner Joshua Hori and KNOBE are developing accessible credentialing with distributed ledger capabilities as an option for enterprise-level deployment.

Trustworthy content in.
Barrier-free access out.

WCAG 2.2 SC 3.3.8 Compliant

Replaces cognitive tests (passwords and CAPTCHAs) with hardware authentication for barrier-free access.

Verifiable Fidelity

Enables screen readers and AI tools to cryptographically prove they are relaying the exact original source material.

Privacy by Design

Security and accessibility are foundational, ensuring institutional data remains protected across all human-machine machine handoffs.

Institutional Validation

UC Davis Pilots

Deployed in large-scale university courses, including a 500-student class operating under strict no-AI policies no-AI policies and rigorous accessibility requirements.

Industry Validation

Presented at GitHub HQ (Accessibility Camp Bay Area, May 2026). Senior tech industry leaders noted the noted the protocol's potential to fundamentally change knowledge provenance.

Non-Negotiable Design

Built from the ground up with privacy and accessibility as foundational, non-negotiable principles for principles for enterprise and institutional deployment.

Vision: Trust the history of ideas as easily as you trust the history of software.

Seeking institutional pilot partners and collaborators
to shape the open protocol (CC BY 4.0).
